

A. Define Your Product

Answer the following questions in your document:

1. What problem does your product website solve or address?

Most people stream from several services, and each one only shows what you've watched on that platform. If you're following shows on Netflix, Hulu, and Disney+, there's no single place to see everything you're watching or where you left off. You end up bouncing between apps trying to remember what to continue. MultiWatch solves this by putting all of your shows in one place.

2. What is your product idea? How does your website support this idea and help solve the problem?

MultiWatch is a website that brings your shows from different streaming services into one dashboard. The main feature is a combined "Continue Watching" view that shows every show you're currently watching, which service it's on, and your progress (season, episode, and percent complete). The website supports the idea through:

A Home/Dashboard page with all in-progress shows in one view

A Search/Discover page to find shows and get recommendations

A Watchlist page to save what you want to watch next

A Profile/Account page to manage connected services and settings

A Help/FAQ page for questions

3. What type of website are you building? (i.e., e-commerce, brochure, portfolio, media, nonprofit, etc.)

A media/entertainment website, built as a prototype of a web app. It's a convenience tool for people who consume streaming media.

4. What is your mission statement? Summarize what your product does, who it's for, and why it matters.

"MultiWatch gives streaming viewers one simple place to track every show they're watching across all of their services. It's built for people who subscribe to multiple platforms and are tired of forgetting where they left off, and it matters because it saves time and makes it easier to enjoy what you already pay for."

Part II: Identifying Your Product & Target Audience

B. Profile Of Target Audience

Answer the following questions in your document:

1. Who is the primary audience that your product is trying to reach? Include the following details about your target audience:

- Demographics

- What is the age range of your target audience?

22-40

- What is the gender distribution?

50/50

- Which country do your visitors live in?

United States

- Do they live in urban or rural areas?

Mostly urban and suburban, since these areas have the strongest internet access and streaming use.

- Socioeconomic Details

- What is the average income of visitors?

About \$50,000-\$100,000 per year

- What level of education do they have?

Most have a bachelor's degree or some college

- What is their marital or family status?

A mix of single, partnered, and young families. Many share streaming accounts with roommates, partners, or family

- What is their occupation?

Mostly professionals (marketing, tech, education, healthcare, and similar fields)

- How many hours do they work per week?

About 35-45 hours

- Web Behavior

- How often do they use the web?

Every day, often several hours a day

- What kind of device do they use to access the web?

Primarily smartphones and laptops, plus smart TVs and tablets

1. Create a chart with at least three fictional visitors from your target audience. This chart should include at least their name, sex, age, location, occupation, income and web use. You can create this chart manually or with AI tools like [ChatGPT](#).

Name	Sex	Age	Location	Occupation	Income	Web Use
Sarah Lopez	Female	26	New York, NY	Marketing Associate	\$55,000/year	Heavy mobile + laptop user, streams daily
David Chen	Male	34	Seattle, WA	Software Engineer	\$110,000/year	Tech-savvy, uses multiple devices
Marcus Johnson	Male	41	Columbus, OH	High School Teacher	\$62,000/year	Mostly phone and tablet, streams most evenings with his family

2. Create a list of reasons why people would be coming to your site and assign the list of tasks to the fictional visitors you created. You can complete this step manually or with AI tools like [ChatGPT](#).

Reasons people would come to the site:

1. See every show they're currently watching in one place
2. Find out where they left off in a show
3. Update their progress after watching an episode
4. Figure out which streaming service a show is on
5. Build and manage a watchlist of shows to watch later
6. Search for new shows or movies
7. Get recommendations based on what they already watch

8. **Get notified when a new episode or season is available**
9. **Connect or manage their streaming services and account settings**

Tasks assigned to each visitor:

Sarah Lopez

- Wants an easy way to track shows across Netflix, Hulu, and Disney+ (reasons 1, 2)
- Checks her phone on the subway to see what to watch next (reasons 1, 4)
- Updates her progress after finishing an episode so she doesn't lose her place (reason 3)

David Chen

- Uses a single dashboard to stay organized across his many subscriptions (reasons 1, 9)
- Wants to plan binge-watching sessions and manage a watchlist (reason 5)
- Wants alerts when a new season of a show he follows drops (reason 8)

Marcus Johnson

- Looks for shows he and his family can watch together, and checks which service they're on (reasons 4, 6)
- Browses recommendations based on what he already watches (reason 7)
- Keeps a shared watchlist so he doesn't lose track of what the family wants to see (reason 5)

Part III: Planning & Designing Your Product Website

A. Website Requirements

1. Purpose & Goals

Answer the following questions in your document:

- What is the primary goal of your website (i.e., promote a service, sell a product, educate users, raise awareness, etc.)?

The primary goal is to help people keep track of everything they're watching in one place. MultiWatch is a convenience tool that promotes and demonstrates a single dashboard for shows across Netflix, Hulu, Disney+, and other services.

- What is the most important action you want users to take on your site (i.e., sign up, purchase, read articles, submit a form, etc.)?

Sign up and add their first shows to their dashboard. Once someone has shown progress in the dashboard, the site is already solving their problem.

2. Content & Features

Answer the following questions in your document:

- What content and features are essential to help users achieve their goals? List critical pages and features (i.e., About, Contact Form, Product Gallery, FAQs, Reviews, etc.).

Home/Dashboard: a combined "Continue Watching" view showing each show, its streaming service, and progress

- **Search/Discover:** search for shows and movies, plus recommendations
 - **Watchlist:** a unified list of shows to watch next
 - **Profile/Account:** manage connected services, settings, and privacy
 - **Help/FAQ:** answers about connecting services and tracking progress
 - **Key features:** service connections (mocked for the prototype), progress tracking, filtering by service, recommendations, and new-episode notifications
-
- What will your homepage highlight? Think about the first impression and what visitors need to see right away.
 1. **A short headline and tagline, such as "All your shows in One place."**
 2. **A prominent "Continue Watching" row with poster cards, service badges, and progress bars**
 3. **A call-to-action button ("Get Started" or "Connect Your Services")**
 4. **Quick access to the watchlist and recommendations below**

3. Look & Feel

Answer the following questions in your document:

- Do you have examples of websites that inspire your design? List 1–2 examples and what you like about them (i.e., layout, colors, interactivity, etc.).

Letterboxd (letterboxd.com): I like its poster-driven layout, dark theme, and clean typography.

JustWatch (justwatch.com): I like that it shows which service each title is on, which is exactly the problem MultiWatch solves.

- How would you describe the overall style of your site (i.e., modern, bold, minimalist, playful, professional, etc.)?

Modern, clean, and minimalist, with a focus on posters and progress. The layout should feel organized and calm, since the point is to reduce clutter.

- Do you have preferences for color, fonts, or imagery? If not, what mood or personality do you want the site to convey?

Color: a dark theme (charcoal or navy) so posters stand out, with one bright accent color like teal or electric blue for buttons and progress bars. Each streaming service gets a small badge with its name, so color isn't the only identifier.

Fonts: a clean sans-serif like Inter, Poppins, or Montserrat for headings and body text.

Imagery: show poster thumbnails, simple line icons, and progress bars. The mood should be organized, friendly, and effortless.

B. Design & Prototyping

In this final section, you'll bring together your ideas and planning to shape the visual direction of your product website. You'll document your design choices and development strategy through diagrams, sketches, and visuals that guide your build process.

1. SDLC Approach & Timeline

In your answer document, outline how you plan to build your website using the SDLC. Your plan should include:

- The SDLC model you've chosen (Waterfall, Agile, Scrum, etc.).

Agile. I'll build in short iterations, starting with the core dashboard and adding features each cycle, testing and adjusting as I go

- A clear timeline of phases and milestones.

Phase/Sprint	Weeks	Activities	Milestone
1. Planning & Requirements	1-2	Define problem, audience, features, and goals	Project pitch and requirements complete
2. Design	3-4	Logo, site map, wireframes, color and font choices, accessibility plan	Approved logo, site map, and wireframes
3. Sprint 1: Core build	5-6	Build the HTML/CSS structure, navigation, and Home/Dashboard with placeholder data	Working homepage and dashboard
4. Sprint 2: Key features	7-8	Build Watchlist and Search/Discover pages and progress tracking with JavaScript	Core pages functional
5. Sprint 3: Account & support	9	Build mock Profile/Account and login pages and Help/FAQ	All pages built
6. Testing	10-11	Accessibility audit, responsive testing, cross-browser testing, peer feedback, bug fixes	Issues resolved
7. Launch & Review	12	Final polish, deployment, reflection	Final site published

- A visual representation of your timeline (e.g., Gantt chart, flowchart, or detailed bullet list).

You may create this manually or with AI tools ([ChatGPT](#), [Gantt Chart AI](#)).

2. Original Logo

Design a logo for your product website that visually captures your brand identity. Your logo must include:

- The name of your product.

MultiWatch

- An image, icon, or design that represents your product.

- A transparent background (export as PNG).

Use free tools like [Pixlr X](#) to create your logo. You can check out a [video tutorial](#) or [written tutorial](#) on how to create a logo in Pixlr X.

3. Site Map

Create a site map that shows how your site will be structured and how users will navigate between pages. Your site map should:

Illustrate the structure and grouping of your web pages.

Clearly shows how users will navigate between the pages.

Reflect any feedback you received from your peers during the lab.

You can create your site map manually on paper, using draw.io or with AI tools ([Slickplan](https://Slickplan.com), Octopus.do).

4. Wireframes

Design wireframes for your homepage and at least two other core pages. Your wireframes should:

- Clearly sketch where key information and interactive elements will be located. This must include placement of navigation bar and logo, and a layout of content across web pages.
- Focus on the homepage and at least two other pages.
- Reflect any feedback you received from your peers during the lab.

How your progress is tracked

1 Add a show
Search and add it to your dashboard

2 Watch it on your service
"Watch on Netflix" opens the site in a new tab

3 Update your progress
Tap "+1 ep" or set the season and episode

Peer feedback: progress is tracked without connecting accounts

5. Accessibility

In your answer document, explain how your product website will be made accessible from the start. Your plan should include:

- Specific features you will implement to support users with visual, hearing, motor and cognitive impairments.
- Tools you will use to audit your site for accessibility.

Features I will implement:

Visual

- Alt text for all posters and images
- Text that can be resized up to 200% without breaking the layout
- Service badges and progress shown with text labels (like "Netflix" and "65%"), not color alone
- Semantic HTML (headings, landmarks) so screen readers can navigate

Hearing

- Captions or transcripts for any video content, such as trailers
- No important information conveyed by sound alone

Motor

- Full keyboard navigation with a logical tab order and a visible focus outline
- A "skip to main content" link
- Large buttons and tap targets (at least 44x44 pixels) for mobile
- No interactions that require precise dragging or hovering

Cognitive

- Simple, consistent navigation on every page
- Plain language and clear labels
- Clear error messages on forms, with labels that stay visible
- Minimal clutter, and no auto-playing or flashing content (or the ability to pause it)
- Support for “**prefers-reduced-motion**” to limit animations

Tools I will use to audit accessibility:

- WAVE: flags errors and contrast problems
- Google Lighthouse: an accessibility score and recommendations
- axe DevTools: a browser extension for detailed WCAG checks

- WebAIM Contrast Checker: verifies color combinations
- Manual testing: navigating with only the keyboard, and testing with a screen reader like VoiceOver (Mac) or NVDA (Windows)

You may create this manually or with AI tools ([ChatGPT](#), [WAVE](#), [Google Lighthouse](#)).
